Nc: Number of Citations; Np: number of publications.

**Table S2. The top 10 most cited research papers**

| Rank | Title   | First Author      | Journal                             | Nc   | Year | Descriptions  |
|------|---|-------------------|-------------------------------------|------|------|---|
| 1    | A Unique Microglia Type Associated with Restricting Development of Alzheimer's Disease [12]                               | Hadas Keren-Shaul | Cell                                | 2311 | 2017 | Using transcriptional single cell sorting, a novel type of microglia associated with neurodegenerative diseases (DAM) was identified. DAM activation is initiated in a TREM2-independent manner, including downregulation of microglial checkpoint, followed by activation of the TREM2-dependent program.  |
| 2    | TREM2 Variants in Alzheimer's Disease [14]  | Rita Guerreiro    | The NEW ENGLAND JOURNAL of MEDICINE | 1910 | 2013 | Gene sequencing was performed to analyze the genetic variability of TREM2 in AD patients and control groups. A meta-analysis was conducted on the TREM2 variant rs75932628. The results showed that the rare heterozygous variation in TREM2 was significantly associated with an increased risk of Alzheimer's disease.  |
| 3    | Variant of TREM2 Associated with the Risk of Alzheimer's Disease [15]   | Thorlakur Jonsson | The NEW ENGLAND JOURNAL of MEDICINE | 1668 | 2013 | In Iceland, a rare missense mutation (rs75932628-T) occurs in TREM2 expression, which is expected to lead to R47H substitution and significantly increase the risk of Alzheimer's disease. R47H substitution may promote the onset of the disease by inhibiting the inflammatory process.   |
| 4    | The TREM2-APOE Pathway Drives the Transcriptional Phenotype of Dysfunctional Microglia in Neurodegenerative Diseases [60] | Susanne Krasemann | Immunity                            | 1269 | 2017 | Specific apolipoprotein E (APOE) dependent molecular features have been found in microglia from ALS, MS and AD patients. The APOE pathway mediates the transition from steady-state to neurodegenerative microglial phenotype after phagocytosis of apoptotic neurons. TREM2 induces APOE signaling and targets the TREM2-APOE pathway to restore the homeostasis of microglia. |

|   |  |                  |                                  |      |      |   |
|---|--|------------------|----------------------------------|------|------|---|
| 5 | Microglia Function in the Central Nervous System During Health and Neurodegeneration [64]          | Marco Colonna    | Annual Review of Immunology      | 1083 | 2017 | Microglia are responsible for clearing antigens, inducing or regulating cellular responses. Review the latest research progress and the role of microglia in aging and neurodegeneration. Identify the difficulties in targeting microglia for neurodegenerative disease's treatment.   |
| 6 | TREM2 Lipid Sensing Sustains the Microglial Response in an Alzheimer's Disease Model [48]          | Yaming Wang      | Cell                             | 980  | 2015 | The lack and incompleteness of TREM2 increases the accumulation of $\beta$ -amyloid protein ( $A\beta$ ), leading to the inability of microglia to aggregate around $A\beta$ plaques and induce apoptosis. TREM2 can perceive a wide range of anionic lipids, which are associated with $A\beta$ .  |
| 7 | Microglia in Alzheimer's disease [59]  | David V. Hansen  | Journal of Cell Biology          | 847  | 2018 | In AD patients, microglia exhibit different activation states. Usually, it has a protective effect, but in the later stages of the disease, microglia may phagocytose and remove synapses through complement-dependent mechanisms to induce pro-inflammatory states, which may be related to the severity of neurodegeneration.   |
| 8 | Microglia in neurodegeneration [36]  | Suzanne Hickman  | Nature Neuroscience              | 786  | 2018 | Neuron damage in diseases such as Alzheimer's disease and Parkinson's disease is caused by the dysfunction of sentinel and defense function of microglia. The injury related pathways include Trem2, Cx3cr1 and progranulin pathways, which serve as immune checkpoints to control the inflammatory response of microglia. The imbalance of microglial cell function may lead to the occurrence or exacerbation of neurodegeneration. |
| 9 | Clearance of apoptotic neurons without inflammation by microglial triggering receptor expressed on | Kazuya Takahashi | Journal of Experimental Medicine | 778  | 2005 | TREM2 overexpression increases the phagocytosis of apoptotic neurons and reduces the pro-inflammatory response of microglia. TREM2 deficiency leads to impaired clearance of apoptotic neurons and inflammation.  |

|    |  |                        |        |     |      |  |
|----|--|------------------------|--------|-----|------|--|
| 10 | myeloid cells-2 [13]<br>Resolving the fibrotic<br>niche of human liver<br>cirrhosis at single-cell<br>level [74] | P.<br>Ramachandra<br>n | Nature | 631 | 2019 | Discover a TREM2 <sup>+</sup> CD9 <sup>+</sup> subset of scar-associated macrophages that expand and promote fibrosis in liver fibrosis. Define the expansion of ACKR1 <sup>+</sup> and PLVAP <sup>+</sup> endothelial cells in cirrhosis. Pro-fibrogenic pathways such as TNFRSF12A, PDGFR and NOTCH signaling also work between these cells. |

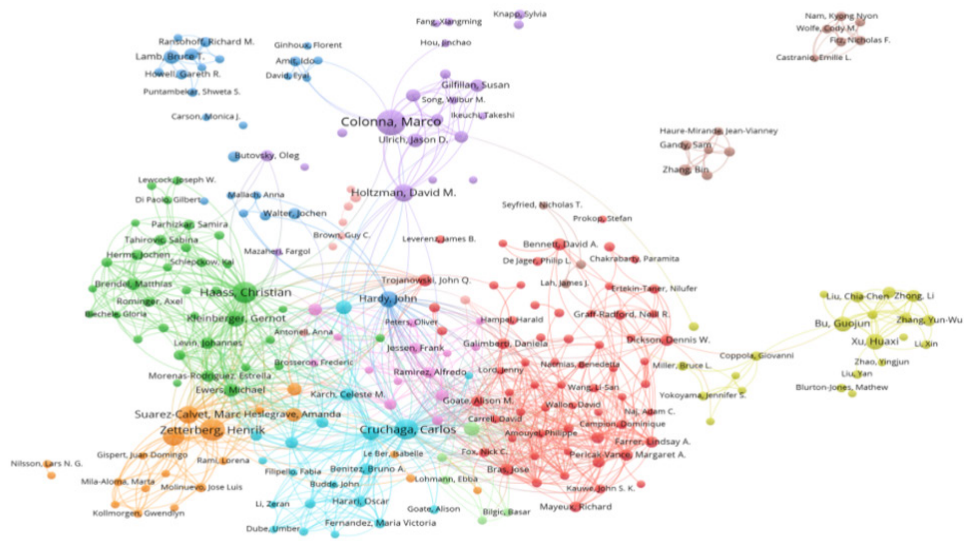

**Figure S1. The contribution of journals related to TREM2.** (A) Bradford's Law is utilized to illustrate core journals in Bibliometrix. (B) Journal cluster map, where the same color within a cluster signifies a consistent focus of the journal. (C) The accumulated publication numbers of the top five core journals.

**Figure S2.** Lotka's law states that the proportion of authors' publication number to the corresponding number of people.

**A****B**

**Figure S3. The contribution of authors and co-cited authors related to TREM2.** (A) A co-occurrence map is employed to visualize authors' collaborative relationships. Only authors who have published more than 5 documents are included in the figure. (B) A co-cited map of authors is presented, where authors with more than 20 citations are organized into five distinct color clusters. Clusters of the same color indicate similar research directions. Node size corresponds to the citation number, while the links represent the frequency of collaboration.
